

SOP 104: Incidental Findings

1 Summary

On rare occasions MRI research personnel may identify neurologic idiosyncracies, termed an ‘incidental finding’, in data collected at the Notre Dame Human Neuroimaging Center (ND-HNC). This document establishes procedures for responding to such incidental findings.

2 Scope

These policies apply to all investigators, research assistants, and staff who collect, review, or use MRI data collected at the ND-HNC.

3 Definitions

- **IRB:** Institutional Review Board, an independent committee that reviews and approves research involving human subjects to protect their rights, safety, and welfare.
- **Operator:** MRI Technologist or Level 4 researcher, responsible for conducting research operations and maintaining equipment. The Lead during emergency responses.

4 Policies & Procedures

The ND-HNC operates primarily as a research facility focused on executing experimental MRI protocols, meaning that collected datasets are not routinely reviewed by a clinician. Given the volume of scans processed at the facility, however, research personnel will occasionally encounter idiosyncratic or anomalous anatomy.

Encountering such idiosyncracies introduces a number of responsibilities which the researcher must navigate to fulfill ethical and legal obligations. Namely, research personnel:

- do not normally use diagnostic MRI protocols nor hold the necessary qualifications to make medical diagnoses,
- must not cause harm to participants by *commission* (e.g. false alarm leading to undue stress, unnecessary medical expenses) or *omission* (e.g. withheld information leading to medical event),
- are required to protect participant anonymity,
- must adhere to IRB regulations of data usage and governance, and

- ought to consult with qualified individuals in case the incidental finding is medically significant.

To help research personnel navigate these obligations, we provide an escalation protocol to be followed whenever incidental findings are detected. A description of these procedures should be included in any IRB application involving use of the ND-HNC MRI scanner.

4.1 Initial Review

All MRI data collected at the ND-HNC should be reviewed by their respective research team. This typically happens during acquisition but may also occur at a later stage. In cases of incidental findings:

- If the individual is still in the bore of the magnet, the Operator should acquire an axial T2-weighted series.
- Research personnel should **NOT** share their concerns with the individual who contributed MRI data.
- The Principal Investigator (PI) should be contacted about the incidental finding. It is the responsibility of the PI to coordinate with ND-HNC staff for External Review and with the participant for any potential Follow-Up.

4.2 External Review

The ND-HNC contracts with qualified clinicians [TBD] to review incidental findings. After a PI contacts ND-HNC staff to initiate an External Review:

- Participant DICOM files are copied to [TBD], an internal, short-term data storage location.
- The clinician reviews the DICOM files either on-site or remotely via the University's secure network.
- The clinician sends their review and recommendations by email to nd-hnc@nd.edu and the director of the ND-HNC, Aron Barbey (abarbey@nd.edu).

4.3 Follow-Up

ND-HNC staff monitor the email account nd-hnc@nd.edu. Once a review is submitted by the clinician, ND-HNC coordinate with the PI.

If a clinical follow-up is **NOT** recommended:

- The DICOM files are removed from [TBD].
- No further action is necessary.

Whereas, if a clinical follow-up **IS** recommended:

- The PI schedules a meeting with the participant, sharing the clinician's review and recommendations.
- The DICOM files are stored at **[TBD]** an internal, long-term data storage location, along with the review notes, in case they are requested in the future.
